UNITED STATES DEPARTMENT OF AGRICULTURE AGRICULTURAL MARKETING SERVICE

FARM PRODUCTION AND INCOME FROM MILK, BY STATES 1938-1939

Commercial supplies of dairy products depend in part on how much of the milk is retained on the farms. During the last few years, an increasing proportion of the milk has been sold in bulk at wholesale, part of it going to dealers for city distribution and part to manufacturing plants for use in making cheese, evaporated milk, ice cream and other dairy products. In 1939 the percentage marketed in this way reached 38.7 percent of the production as compared with 33.3 percent in 1934. The percentages used for most other purposes are declining. In 1939, 31.4 percent of the milk was skimmed on the farms and sold as cream at wholesale, most of it being sold on a butterfat basis for making creamery butter and 6.2 percent of the milk was retailed by farmers as milk or cream for fluid consumption. Farm-made butter sold, formerly an important item, took only 1.7 percent of the milk. A small proportion was fed and the remainder was utilized as milk, cream or butter on the farms where produced.

UNITED STATES DEPARTMENT OF AGRICULTURE AGRICULTURAL MARKETING SERVICE

FARM PRODUCTION AND INCOME FROM MILK

Summary

Milk and milk products sold from farms in the United States in 1939 increased more than 1 percent from the quantities sold in 1938 and accounted for most of the 1-1/3 billion pound increase in milk production, the Agricultural Marketing Service reports. Lower prices received by farmers for dairy products, however, more than offset the increase in quantities sold and total returns to farmers from sales of dairy products, totaling \$1,355,067,000 in 1939, were less than the 1938 returns by about 40 million dollars or 3 percent. The quantity of milk, cream, and homemade butter consumed on farms where produced was about the same as in 1938, but at \$368,417,000 the value of the home-consumed products was about 11 million dollars less.

Production of Milk and Butterfat Increased, Farm Butter Decreased

Milk production on farms in the United States increased 1.2 percent in 1939 over the previous year. The average number of milk cows on farms during the year increased a little less than 1 percent. Production per milk cow was also slightly higher than in 1938 and, except for 1929, was the highest in the 16 years for which annual estimates are available.

2/ Estimates exclude milk sucked by calves and milk produced by cows not on farms.

Revised.

Preliminary.

Production of farm-churned butter in 1939 continued the downward trend that has been noted for several years with output estimated at 486 million pounds, compared with 500 million pounds in 1938. Declining 13 percent since 1934, production in 1939 was the smallest quantity churned on farms since shortly after the Civil War. Creamery butter has been gradually replacing farm butter for many years, but in the South, where a majority of the milking herds contain only one or two cows and where many prefer buttermilk to sweet milk for drinking purposes, the butter churned on farms is still nearly double the quantity churned in commercial plants.

In table 1 are shown annual estimates of milk cow numbers, milk and butterfat production and the quantity of butter churned on farms in the United States

in the last 6 years. For details by States in 1938 and 1939 see tables 5 and 8.

Wholesale Deliveries of Milk and Cream Increased in 1939

Wholesale milk deliveries by farmers in 1939 were about 42 billion pounds. The increase over the quantity so sold in 1938 was 2 percent which represents a continuation of the shift towards wholesale milk sales that has been noted for a number of years. Somewhat less than three-fifths of the 42 billion pounds was used by dealers for sale as fluid milk and cream, and the remainder was utilized for production of manufactured products.

More than 70 percent of the milk sold wholesale by farmers was produced in the area east of the Mississippi and north of the Ohio and Potomac Rivers. This area has about two-thirds of the large-city population of the country and produces more than two-thirds of the manufactured dairy products other than butter.

Estimates of annual wholesale deliveries of milk by farmers in the United States and quantities used for other purposes from 1934 through 1939 are shown in table 2.

^{1/} Total milk used on farms for making butter may be computed by combining the milk used in butter consumed in the farm household and milk used in farm-churned butter sold.

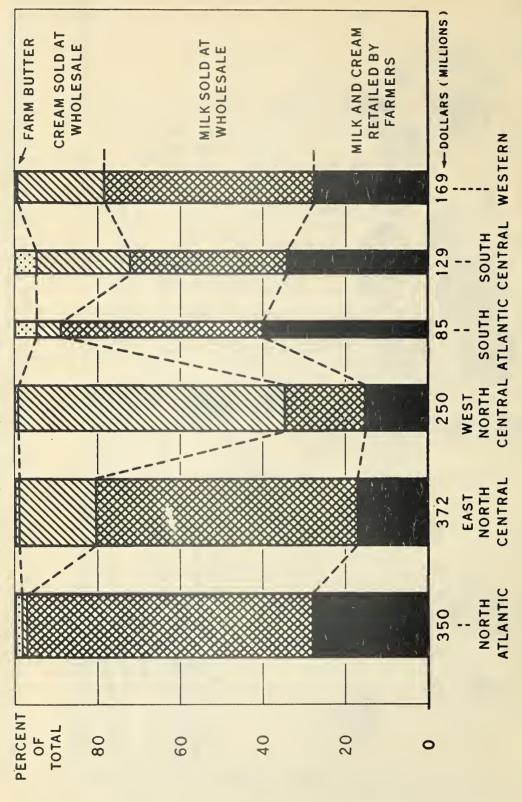

^{2/} Revised. 3/ Preliminary.

U. S. DEPARTMENT OF AGRICULTURE

There are wide differences between States in the quantities and in the proportion of the milk used for each purpose. The quantity retailed in each State depends in part on the number of people in small cities and towns. Milk is soid at wholesale where it is needed for city consumption or for making manufactured products. Green is sold at wholesale mostly in areas where what was a needed local needs, but even in market milk produced manufactured production accessed local needs, and are are accessed local and areas where only delivery of milk. For more are kept, but some are kept, but some is a made by farmers with larger hard in a price received for creen is low compared with the cost of purchased butter. The quantity of milk consumed in farm households tends to be proportional to the number of people on the farms.

THE VARIOUS DAIRY PRODUCTS SOLD FROM FARMS, 1939, BY GROUPS OF STATES RELATIVE VALUES OF

U. S. DEPARTMENT OF AGRICULTURE

NEG. 235 AGRICULTURAL MARKETING SERVICE

In all parts of the country farmers sell milk and cream to concumers, to dealers and to manufacturing plants, and in most scotions there is some retail markets for make the results. In the demsety proplated forth Atlantic area the artestly markets for malk the practically all that is arealized in the Test forth Central States, where there are five times as many cows per 100 people as in the Brothest, and distances to consuming markets are greater, sales of milk in the state there are five times as many cows per 100 people as in the Brothest, and distance and a seal part of the total and farmers' sales of milk for the their males of other dairy products. In the state commercial dairying has been dersolom meeting to meet the local wholesale and retail damend for milk for find consumption but some farm butter is still soils. The rectional differences in market outlass materially affect the returns from the dairy products and total for find consumption but some farm butter is still soils. The

Wholesale cream sold by farmers in 1939, mainly for use in the commercial manufacture of butter, is estimated to have utilized the butterfat from 34 billion pounds of milk. The increase over 1938 was a little more than 1 percent or about the same percentage as the increase in milk production. Wholesale cream sales accounted for about 31 percent of the milk produced on farms, and for about 40 percent of the milk utilized in products sold from farms.

The quantity of milk and cream retailed by farmers in 1939 is estimated as equivalent to 6.8 billion pounds of milk. As increasing stringency of sanitary regulations require more equipment for processing and delivery of bottled milk and cream, many farmers who formerly delivered milk directly to consumers appear to be selling to dealers who have pasteurizing equipment. As a result of recent reports from officials in many small cities and towns, the estimate of the total quantity of milk and milk equivalent of cream retailed by farmers in 1939 was reduced to about 3 percent below the estimate for 1938 but the decrease may not all have occurred in the one year. Most of the decrease appears to have taken place in the northern States from Minnesota and Iowa eastward through New York.

Sales of farm-churned butter declined further in 1939 and utilized only 1.8 billion pounds of milk or about one-sixth as much as was used 40 years ago.

Farm Usage of Milk Changed Relatively Little

The quantity of milk consumed in the households on farms where produced showed only small changes in 1939 from the previous year, some increase in the quantity consumed as milk and cream being nearly offset by a further decrease in the quantity used in farm-churned butter consumed in the farm households. The quantity of whole milk fed to calves in 1939, estimated at 3.0 billion pounds, was a little more than the usual proportion of the quantity produced probably because of the larger proportion of the calves raised.

Sales of Dairy Products Decreased with Lower Prices

As a result of lower prices for dairy products in 1939, the returns to farmers from the sales of dairy products were lower than in the preceding year. Compared with 1938, farm butter prices showed the sharpest relative decline—6 percent—and, with the quantity sold 5 percent less, a decline of 11 percent in farm butter sales resulted. On an actual value basis, however, sales of wholesalecream showed the greatest reduction. Although the quantity of butterfat in cream sold at wholesale in 1939 was about 1 percent larger than in 1938, lower prices for butterfat, particularly in the early part of the year when storage stocks of butter were unusually high, resulted in a reduction in sales amounting to nearly 27 million dollars or 8 percent. The returns from milk retailed by farmers for direct human consumption were moderately lower than in 1938, chiefly as the result of smaller quantities of bottled milk and cream delivered by producers. The increased quantities of wholesale milk sold by farmers more than offset the somewhat lower prices received per 100 pounds, and the value of sales in 1939 was slightly larger than in 1938.

Quantities of various dairy products sold from farms, prices, and values of sales for the years 1934-39 are shown in table 3.

Wisconsin Ahead in Cash Returns; New York Second

Wisconsin led all States in 1939 in the quantity of milk and milk products sold from farms, with 11 billion pounds of milk or milk equivalent. In value of sales, however, Wisconsin with a cash return of 135 million dollars to farmers for dairy products was closely pressed by New York with 134 million dollars. States following Wisconsin and New York in the value of dairy products sold were, in order, Pennsylvania, Minnesota, and California.

The States leading in the value of the milk consumed (as milk, cream, or butter) on the farm where produced were: Texas, North Carolina, Alabama, Georgia, and Tennessee. All of these States rank near the top in farm population, in farm butter production, and in total quantity of milk consumed on the farms. 1/

On the basis of the combined value of dairy products sold from farms and consumed on farms where produced, New York led in 1939 with a gross farm income of 144 million dollars, followed by Wisconsin, Pennsylvania, Minnesota, and California in the order named.

For detailed figures by States on quantities of dairy products sold, prices and values of products sold, see tables 7 and 10.

Following the usual procedure, all the milk consumed in the farm households (as milk, cream, or farm butter) was given the same value per 100 pounds as the average price secured in the same State from milk marketed during the year as milk, cream, or butter. No additional value was added for skim milk and buttermilk consumed.

Decreased Average Returns for Milk Used in Products Sold.

In 1939 the returns received by farmers for milk utilized in dairy products sold averaged \$1.60 per 100 pounds for the country as a whole. This was between 4 and 5 percent lower than in 1938, and the lowest average return for any year since 1934. As compared with the previous year, the sharpest percentage reduction was felt by farmers in the important butterproducing States of Minnesota and Iowa, where prices averaged about 10 percent lower in 1939 than in 1938. Very little decline from 1938 occurred in the North Atlantic fluid milk area where prices of milk held up very well, and only moderate decreases were apparent in most of the South and West.

As usual, returns per hundred pounds of milk used showed wide variation, the averages being highest where milk production is low in comparison with the population and where much of the milk can be retailed or sold at wholesale for fluid consumption. The averages were lowest in the Dakotas and some other States where most of the milk is skinmed on the farm and shipped out as cream. Averages for individual States were also affected by distance to markets, quality, quantity sold, and other factors which affect the prices of the individual products. The average returns, ranged from 96¢ per 100 pounds of milk in North Dakota to \$4.39 in Florida.

More of Milk Sold from Farm Used for Fluid Consumption

Nearly five-eighths of the milk and cream sold (wholesale and retail) by farmers in 1939 was utilized in factory dairy products, most of the remainder being consumed as fluid milk and cream by people not on farms. Factory butter was the largest single item, 2 utilizing 43 percent of the total, compared with

^{1/} The ranking of the various States depends somewhat on the method of valuation used.

^{2/} Based on preliminary estimates of dairy products manufactured in 1939. Final results of enumerations not yet available.

somewhat over 8 percent for cheese, 6-1/2 percent for concentrated milk products, and 4 percent for ice cream. Consumption of fluid milk and cream by people in cities, villages and rural non-farm places accounted for 37 percent of the total, leaving 1-1/2 percent for other uses. As compared with 5 years earlier, the increase of 8 billion pounds of milk and milk equivalent of cream sold from farms was distributed as follows: 3-1/2 billion pounds for increased fluid consumption, 1-1/2 billion for larger factory output of creamery butter, and about a billion pounds each for ice cream, cheese and concentrated milk products. Detailed estimates of annual commercial utilization of the milk and milk equivalent of cream sold by farmers in the United States in the years 1934 to 1939 will be found in table 4.

1/ Includes both wholesale and retail sales by farmers.

2/ Net, after deducting allowance for whey cream used in manufacture of butter.

3/ Net, after deducting allowance for butter and concentrated milk products used in ice cream.

4/ Products included are evaporated, condensed, dry and powdered whole milk, malted milk, and dry or powdered cream.

5/ Same as published estimates of "Milk used for fluid consumption as milk or cream in cities and villages" less a flat allowance of 2,400 million pounds for the portion of this milk that is assumed to have been produced by cows kept elsewhere than on farms. While no separate allowance has been made for the billion pounds or more of milk purchased by farm families without cows in production there is some evidence that the totals shown may be high enough to include such milk. These totals include the milk retailed by farmers, shown separately in table 2.

6/ Represents the differences between estimates of quantities sold and of quantities used for the purposes shown. It includes net effects of imports, exports, and year-end storage holdings of milk and cream, and miscellaneous losses and uses not shown separately, together with errors in estimates of milk and cream sold or consumed, in the computed milk equivalents of manufactured dairy products, in the allowances for duplication and in the allowance for production by non-farm cows.

7/ Preliminary. Milk used for manufactured dairy products computed from preliminary indications of changes in United States totals. Milk sold for fluid consumption based on assumption that the total consumption by non-farm population was 2 percent over the 32,408 million estimated for 1938, indicating 33,056 million pounds from which 2,400 million pounds were deducted as explained in note 5.

			of milk, c				vided by th	e quantity o	milk or

butterfat used in the preparation of these products for market.

2/ Milk and milk equivalent of cream and farm butter consumed, valued at the average returns for milk utilized in dairy products sold.

3/ Value of combined sales plus value of products consumed in the farm household.

Estimates for 1939 are preliminary.
